5.Sample Questions / Use Cases	3
6. Data / System Access Required	3
7. ROI & Business Impact (Important Section)	3
8.Priority & Risk	4

1. Purpose

The purpose of this agent is to automatically extract the profiles relevant to the job requirements from (Nvites, applications and job postings) and to parse the candidate data (name, role, experience, location, compensation, notice period, and other attributes) from unstructured email content.

2. Business Problem

Recruiters currently screen candidates by manually reading through Outlook emails - NVite notifications, direct applications, and Naukri postings. Processing 100 applications manually, and checking those candidates against a job description takes 3-4 hours.

As it is manual, only about 30% of candidate profiles get fully captured (role, experience, location, salary expectations, notice period, skills). The rest sit in inboxes as unstructured text, where good candidates are missed and availability isn't tracked consistently.

3. Objective

- Automatically extract relevant candidate profiles from Outlook email
- Let a recruiter upload a job description and get candidates ranked against it
- Raise candidate data coverage from ~30% to 70%+
- Cut manual screening effort by roughly 90%
- Deliver one filterable report recruiters can act on directly, instead of raw emails

4. Target Users

User	How they use the agent
TA Team	Upload JDs, review ranked shortlists, filter by notice period or skills

5. What Should the Agent Do?

- Connect to Outlook/Microsoft 365 and search for candidate-related emails (NVite, applications, and Job postings)
- Extract relevant candidates for the given job description.
- Extract candidate details: name, contact info, role, experience, location, salary expectations, notice period, skills

- Accept a job description as a Word file, PDF, plain text, or a keyword list, and parse it into required skills, experience level, location, and salary range
- Score each candidate 0-100 against the JD and rank the results
- Flag required skills a candidate is missing
- Deduplicate candidates who appear across multiple emails or sources
- Produce a filterable report (Excel, PDF, Word) by score, notice period, experience, or location

6. Sample Questions / Use Cases

- "Pull every candidate who applied for the Senior Data Engineer role in the last two weeks."
- "Rank these candidates against this JD and tell me who's the strongest fit."
- "Which candidates can join within 15 days and score above 70?"
- "What skills is this candidate missing compared to the JD?"
- "Give me a shortlist report for the Bangalore Data Analyst requisition, filtered by notice period."

7. Data / System Access Required

- Outlook / Microsoft 365 mailbox access via Microsoft Graph API
- Output storage location for generated Excel/PDF/Word reports

8. ROI & Business Impact (Important Section)

A. Current Effort

How many hours per week are spent on this activity? It takes 5-6 hours

How many people are involved?

Approx. cost per month (if known): NA

B. Expected Improvement

Estimated % of automation expected: 90 %

Expected time saved per week/month: 5-6 hours per week

Expected cost saving per month: NA

- Improved efficient candidate screening from mass profiles
- Better data coverage of candidates
- Increased hiring productivity
- Scalable solution for bulk hiring
- Time saving
- Reduces the chance of strong profiles being missed manually

Metric	Current (Manual)	With Agent
Time to process 100 applications	3-4 hours	Under 3 minutes per batch of 50-100 emails
Time to screen candidates against a JD	1-2 hours	Under 5 seconds per JD
Candidate data coverage	30%	70%+

9. Priority & Risk

Priority: High

Is there any business risk if output is incorrect?

No

If yes, explain briefly: _____
